Report 10-19-2018

## **10-19-2018 Report**

During the last week, our team has finished developing both the basic app and the face cropping/detection parts, we have also begun to merge these two parts with great success. We are able to detect a face and classify what emotion the face has, while also being able to display the correct image based on that emotion. There is currently a bug in the software where faces that are too close to the camera cause a hard crash, but the cause of the bug has potentially been identified and should be fixed before the deadline.

Besides that, we formatted the requirements and Debra approves of them. We have sent the requirements along with this report and would like you to read through it for approval as well, simply put your signature and date of approval on page 8.
